## Frequently Asked Questions

# Upgrading to Windows 11

---

### Introduction

Windows 11 is now available for upgrade for the Windows 10 machines.

### Our recommendations

**2/22/22** - Currently, we do not recommend upgrading to Windows 11. We are in the process of testing our programs in Windows 11, but the BSI products have not yet been thoroughly tested to know how they run and what problems they may have.

**Update as of 1/20/23** - We are continuing to test our BSI products in Windows 11, and we still cannot fully recommend Windows 11 for reliable operation of Simian long-term. We have seen the following issues:

- All BSI products need to be installed as an administrator or they cannot save scheduled events or trigger sets to the system.
- Simian Lite will error out on the BSINet32.dll file after running for several hours.
- Info Edit would not run as a stand-alone product on the default user after upgrading from Windows 10 to 11.

Please be patient as we continue our testing.
