What's New in Simian 3.0?

Simian 3.0 is the latest iteration of the Simian application. It contains numerous new and updated features, most notably:

- **No dongle needed** – Simian 3.0 is completely dongleless. If you are currently using a dongle for your older version of Simian, you will need to return it to the company.
- **DataMonkey Database Utility** - Use DataMonkey as an alternative to SoundHound. DataMonkey sets up your folder structure for you, creates a separate xBase (dbf) database in each folder, and then exports the information to the Simian audio.mdb database.
- **Improved database performance** - Building and accessing the database using the Event Builder, SoundHound, and DataMonkey has been optimized. The database bloat issue has also been fixed.
- **Storage of registration information** - Corrected issues which caused problems after Windows updates/sudden power outages which would block access to the registration information in the Windows registry.
- **Changing Serial Numbers** - Corrected issues that would cause the serial number to change in the dongleless versions of our software.
- **UI Improvement** - Larger/easier to see buttons, removal of obsolete tabs in the Event Builder, faster refresh in the Event Builder, and sunseting of obsolete devices on the hardware tab in the Hardware Options.
